

Red Hat Insights

Executive report: Advisor

This report is an executive summary of recommendations that may impact your Red Hat Enterprise Linux servers. Red Hat Advisor service is analyzing 14,388 RHEL systems and has identified 5,446 Risks that impact 1 or more of these systems.

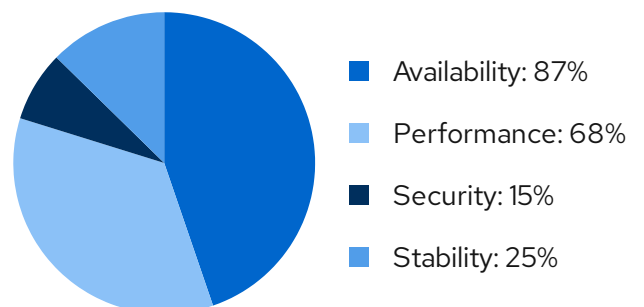

Identified recommendations by severity

Severity	Number of recommendations
Critical	11 (0% of total)
Important	1862 (34% of total)
Moderate	4821 (89% of total)
Low	3006 (55% of total)

Recently identified recommendations by category

Category	Number of recommendations
Availability	4759 (87% of total)
Performance	3727 (68% of total)
Security	802 (15% of total)
Stability	1346 (25% of total)

Top 3 recommendations in your infrastructure

Systems exposed

11

Total risk

 Critical

Kernel panic occurs due to a bug in the mitigation part of KVM for L1TF bug fix Kernel panic occurs when the mitigation control for KVM is read or KVM guest is started on a system with L1TF mitigation without EPT support.

Systems exposed

719

Total risk

 Important

SAP instances failure occur when the values for some resource limits are below the SAP recommended values SAP applications require certain file handler or process resource in order to keep the application running properly. When resource limits do not meet SAP requirements, the SAP application will fail to run or its performance will degrade.

Systems exposed

714

Total risk

 Important

Decreased security: Unsupported RHEL release This system is not able to get latest package via subscription tool.
